ABSTRACT OF THE DISCLOSURE

A capturing and viewing appliance and method are used for capturing and communicating images. The capturing and viewing appliance is an instrument used to capture and communicate images to other devices with communication capabilities. The capturing and viewing appliance includes a processor for manipulating and viewing the images on a built-in display. Program code stored in internal memory includes a menu/image navigation application program which allows the user to use navigation buttons to view multiple images as well as navigate menus. According to another aspect of the invention, the menu/image navigation interface provides a userfriendly interface for effective communication of functionality of an appliance or other device to the user through use of animated transitions. Through the use of icons, menus, navigation buttons and animated transitions used to communicate functionality to the user, the present invention presents a novel user interface which makes the menu/image navigation user interface and method a solution in devices with limited resources which need to be able to navigate among multiple images arranged in different orientations. The menu/image navigation appliance and method is designed for navigating among multiple captured images and operating the appliance using menus through instrument reuse which is especially useful in portable hand-held appliances or other devices which are capable of displaying images where space and compactness are a concern.
